Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

- 1. (Currently amended) In a multi-user computer system, a method of controlling the creation of a user session, comprising processing a log-on request entered by a user <u>at a terminal</u>, wherein the creation of the user session is halted when more than a maximum number, <u>maintained as a variable in the multi-user computer system</u>, of log-on requests are being processed simultaneously.
- 2. (Original) A method according to claim 1, wherein the creation of a user session is resumed when the creation of another user session has been completed.
- 3. (Original) A method according to claim 2, wherein each log-on request is assigned a slot at a certain position in a waiting queue of currently pending requests, wherein the log-on request is assigned to a next slot in the waiting queue when a user session has been created.
- 4. (Original) A method according to claim 3, wherein information on the position of the logon request in the waiting queue is displayed to the user.
- 5. (Original) A method according to claim 3, wherein a user session of which the creation cannot be completed is detected, and the log-on request to create the users session is removed from the waiting queue.
- 6. (Original) A method according to claim 5, wherein a slot to which a log-on request has been assigned is continually updated with information regarding the creation of the requested user session, and wherein a log-on request is removed from the slot to which it has been assigned if the slot is not updated.
- 7. (Original) A method according to claim 1, wherein a user is provided with an option to cancel a log-on request when the creation of the user session is halted.

U.S. Patent Application No.: 10/087,044

- 8. (Original) A method according to claim 7, wherein a user is provided with an option to cancel a log-on request together with the information displayed to the user.
- 9. (Original) A method according to claim 1, wherein statistics relating to the creation of user sessions during a certain time interval are updated when the creation of a user session has been completed.
- 10. (Currently amended) A multi-user computer system, comprising at least one terminal for a user to enter a log-on request for creation of a user session, wherein the system further comprises means for determining the number of log-on requests simultaneously being processed, and means for halting the creation of the user session if the number of log-on requests simultaneously being processed exceeds a maximum number, maintained as a variable in the multi-user computer system.
- 11. (Currently amended) A multi-user computer system according to claim 910, comprising a waiting queue with active slots and wait slots, wherein the number of active slots equals the maximum number, further comprising means for assigning each log-on request to a slot at a certain position in the waiting queue.
- 12. (Currently amended) A multi-user computer system according to claim 1011, comprising means for assigning a log-on request to a next slot in the waiting queue when a user session has been created, wherein assignment of a log-on request to an active slot triggers the system to resume the creation of the requested user session
- 13. (Currently amended) A multi-user computer system according to claim 1011, comprising means for adjusting the number of active slots.
- 14. (Currently amended) A computer program for controlling the creation of a user session in a multi-user computer system, comprising computer-readable instructions for performing the tasks of one or more routines for processing a log-on request entered by a user at a terminal, one or more routines for determining the number of log-on requests simultaneously being processed and

U.S. Patent Application No.: 10/087,044

Page 5

a routine for halting the creation of the user session when more than a maximum number, maintained as a variable in the multi-user computer system, of log-on requests are being processed simultaneously.

- 15. (Currently amended) A computer program according to claim 1314, comprising computer-readable instructions for performing the tasks of one or more routines for assigning each log-on request to a slot at a certain position in a waiting queue of currently pending requests, and for assigning the log-on request to a next slot in the waiting queue when a user session has been created.
- 16. (Currently amended) A computer program according to claim 1415, comprising computer-readable instructions for performing the task of one or more routines for displaying information on the position of the log-on request in the waiting queue to the user.
- 17. (Currently amended) A computer program according to claim 1415 comprising computer-readable instructions for performing the tasks of one or more routines for detecting a user session of which the creation cannot be completed, and for removing the log-on request to create the user session from the waiting queue.
- 18. (Currently amended) A computer program according to claim 1314, comprising computerreadable instructions for performing the task of one or more routines for adjusting the maximum number of log-on requests.
